

Diego Rodriguez

- 4.- I would say that the implementation of a universal prog. language seems unreal, given that it has to run on diff. types of hardware, optimization would be very hard to achieve. Also, feature wise it would be cumbersome, as that might not be the best way to implement that feature.
- 17.- In my opinion, ending lines with semicolons seems more natural and easier than to separate statements, as it seems easier to do as a typing reflex, rather than typing a closing statement and then add a semicolon
- 18.- Both types of comments are great, but each has it's own advantages. For example, if you were which set of conditionals will work to achieve something in your program, multiline comments will work better, since you can specify where the comment ends. Single line comments work better for quick explanations of variables.
